This study involved all adult patients diagnosed with pneumonia undergoing inpatient care in the Gathutkaca Ward of Jombang Regional Hospital. The population observed during the study period was 50 patients. The research design used was descriptive quantitative with a retrospective approach based on the medical records of 50 pneumonia patients in 2023. The results showed that the majority of patients were female (62%), with the highest age being less than 59 years (68%), with the highest education level being elementary school (32%), and the highest occupation being self-employed (34%). The longest hospital stay was 4 days (30%), with the largest cost coming from medication use amounting to Rp. 119,997,897. The conclusion is that Ceftriaxone is effective in reducing pneumonia.
